

CSS IMPROVEMENTS REPORT

Website Redesign — Before & After Review

This document outlines all improvements made to the website's CSS and HTML. Each section details what was broken or outdated, and what was implemented in its place — covering colours, typography, navigation, imagery, buttons, animations, layout, and bug fixes.

Colours

Background

BEFORE	AFTER
Plain dark green — default paint colour with no design intent.	Deep black with a faint grid pattern and brass/gold texture. Professional and polished.

Text Visibility

BEFORE	AFTER
All text set to color: black — invisible on a dark background.	Text updated to soft white throughout, ensuring full readability.

Buttons & Links

BEFORE	AFTER
Bright aqua/cyan button backgrounds — very dated, early-2000s appearance.	Dark buttons with a gold outline; fill with colour on hover using a smooth wipe effect.

Fonts & Typography

Font Family

BEFORE	AFTER
Browser default fonts (Times New Roman / Arial) — no custom fonts loaded.	Three Google Fonts loaded: a bold military-style heading font, a clean body font, and a typewriter-style font for navigation.

Font Sizes

BEFORE	AFTER
--------	-------

Sizes set manually per element — 50px here, 30px there. Inconsistent and hard to maintain.	A single consistent size scale that automatically adjusts to screen size.
--	---

Line Spacing

BEFORE	AFTER
line: height 30px — a typo the browser ignored completely. Line spacing was effectively broken.	Correct line-height applied throughout, giving text proper breathing room.

Header & Navigation

Logo / Brand

BEFORE	AFTER
Site name in an italic tag with black text — invisible against the dark header.	Bold uppercase white text with a gold glow and a diamond icon. Slides in on page load.

Nav Link Styling

BEFORE	AFTER
Spacing added inline on every single link individually — messy, repetitive code.	CSS handles spacing once for all links. Each link gets a smooth underline slide-in on hover.

Visited Link Colour

BEFORE	AFTER
Clicked links turned purple — default browser behaviour, looked unintentional.	Links maintain consistent colour whether visited or not.

Broken Nav Tag

BEFORE	AFTER
One page used <navSCS> — a tag browsers do not recognise. Navigation was broken.	CSS targets the correct <nav> tag. Menu now works and aligns properly.

Images & Gallery

Image Sizing

BEFORE	AFTER
--------	-------

height: 40% written inline — doesn't work as written. Images were unpredictable sizes.	Fixed height applied to all images. They cover their space neatly with consistent sizing.
--	---

Image Styling

BEFORE	AFTER
Raw bright images clashing badly with the dark green background.	Images slightly darkened and desaturated to match the theme. On hover: they brighten, zoom in slightly, and get a gold border glow.

Gallery Layout

BEFORE	AFTER
Gallery images stacked using tags — like a Word document, not a website.	Proper 3-column CSS Grid used. All images sit side by side cleanly.

Animations & Effects

None of the following existed before — all were newly added:

Crosshair Cursor: The default arrow cursor is replaced with a crosshair site-wide — perfectly suited to a shooting range theme.

Heading Fade-In: Headings start invisible and slide up into place when the page loads.

Image Zoom on Hover: Gallery images slowly zoom in when you hover over them.

Gold Header Strip: A gold line flickers along the bottom of the header — a glowing accent effect.

Scanline Overlay: Subtle scanlines across the whole page give it the look of a military monitor screen.

Layout & Spacing

Content Alignment

BEFORE	AFTER
Everything either randomly left-aligned or centred using text-align: center on every single element.	CSS centres and constrains all content to a readable width in one place.

Section Spacing

BEFORE	AFTER
Sections had no breathing room — content was crammed together.	Consistent padding and spacing applied throughout. Page feels organised and easy to read.

Footer Layout

BEFORE	AFTER
flex-shrink: o (letter O instead of zero) — the footer layout was completely broken.	Fixed to 0. Footer now lays out correctly in three columns with a faint TSR watermark.
